

# Investigating Internet Censorship with ooniprobe

Free software project (under the Tor Project) aimed at empowering decentralized efforts in increasing transparency of Internet censorship around the world.

Since 2012, OONI has collected millions of network measurements *across more than 100 countries* around the world, shedding light on various instances of network interference.

ooniprobe 2.2.0.rc1 | **running**  | Location: IS (AS47172)

Test Tor

Test the Web

Test Instant Messaging Apps

Test for Middle Boxes

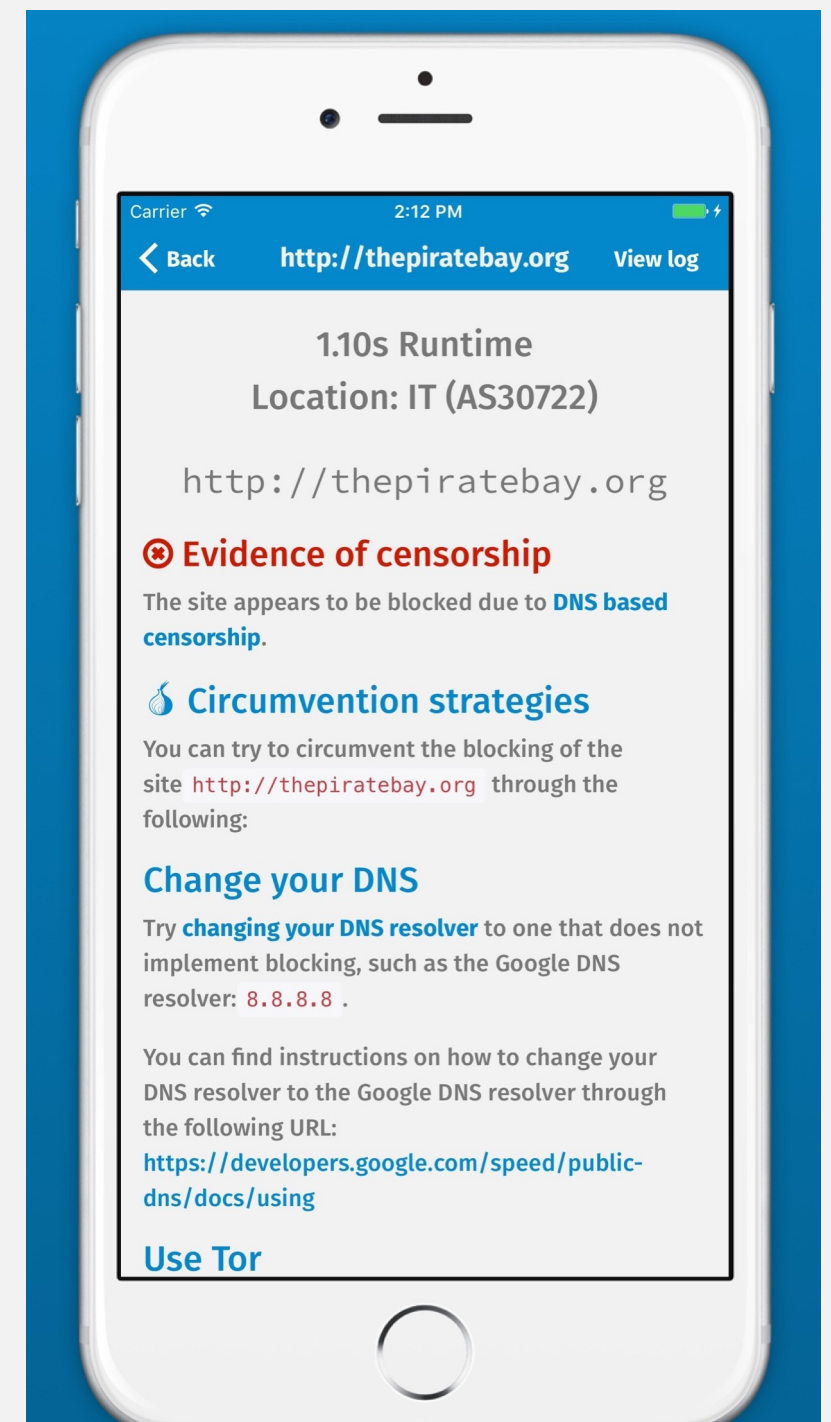

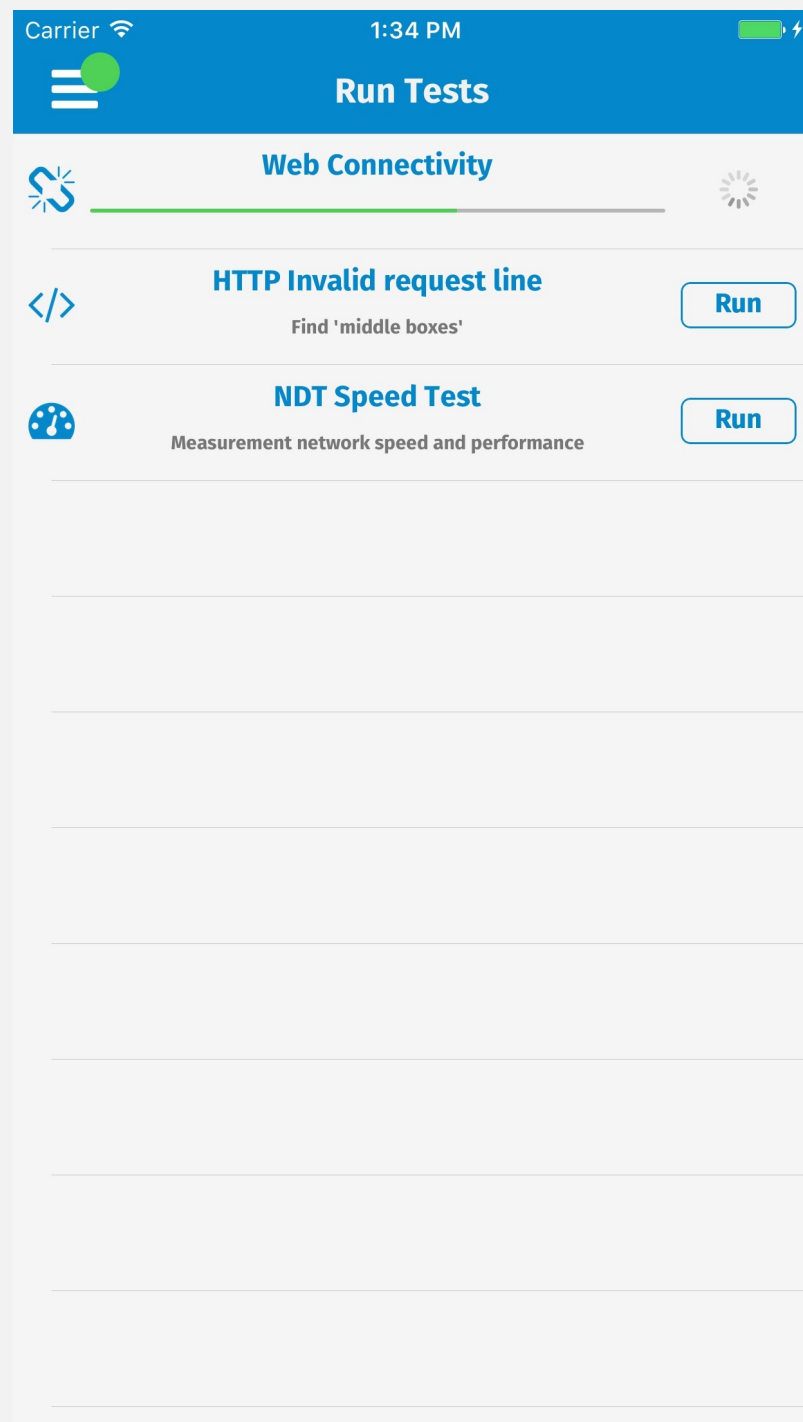

Your recent test results will appear here once the tests have finished running! As you run more tests, you can view past results in the "Measurements" page.

# ooniprobe web user interface

ooniprobe on RaspberryPi

# ooniprobe mobile app

- Anyone monitoring your internet activity (e.g. ISP) will know that you are running ooniprobe.
- Types of URLs tested include provocative or objectionable sites (e.g. pornography).
- OONI's "HTTP invalid request line" test could be viewed as a form of "hacking".
- The use of ooniprobe might potentially be viewed as illegal or anti-government activity.

<https://ooni.torproject.org/about/risks/>

Risks: ooniprobe is a tool for investigations!

Probe

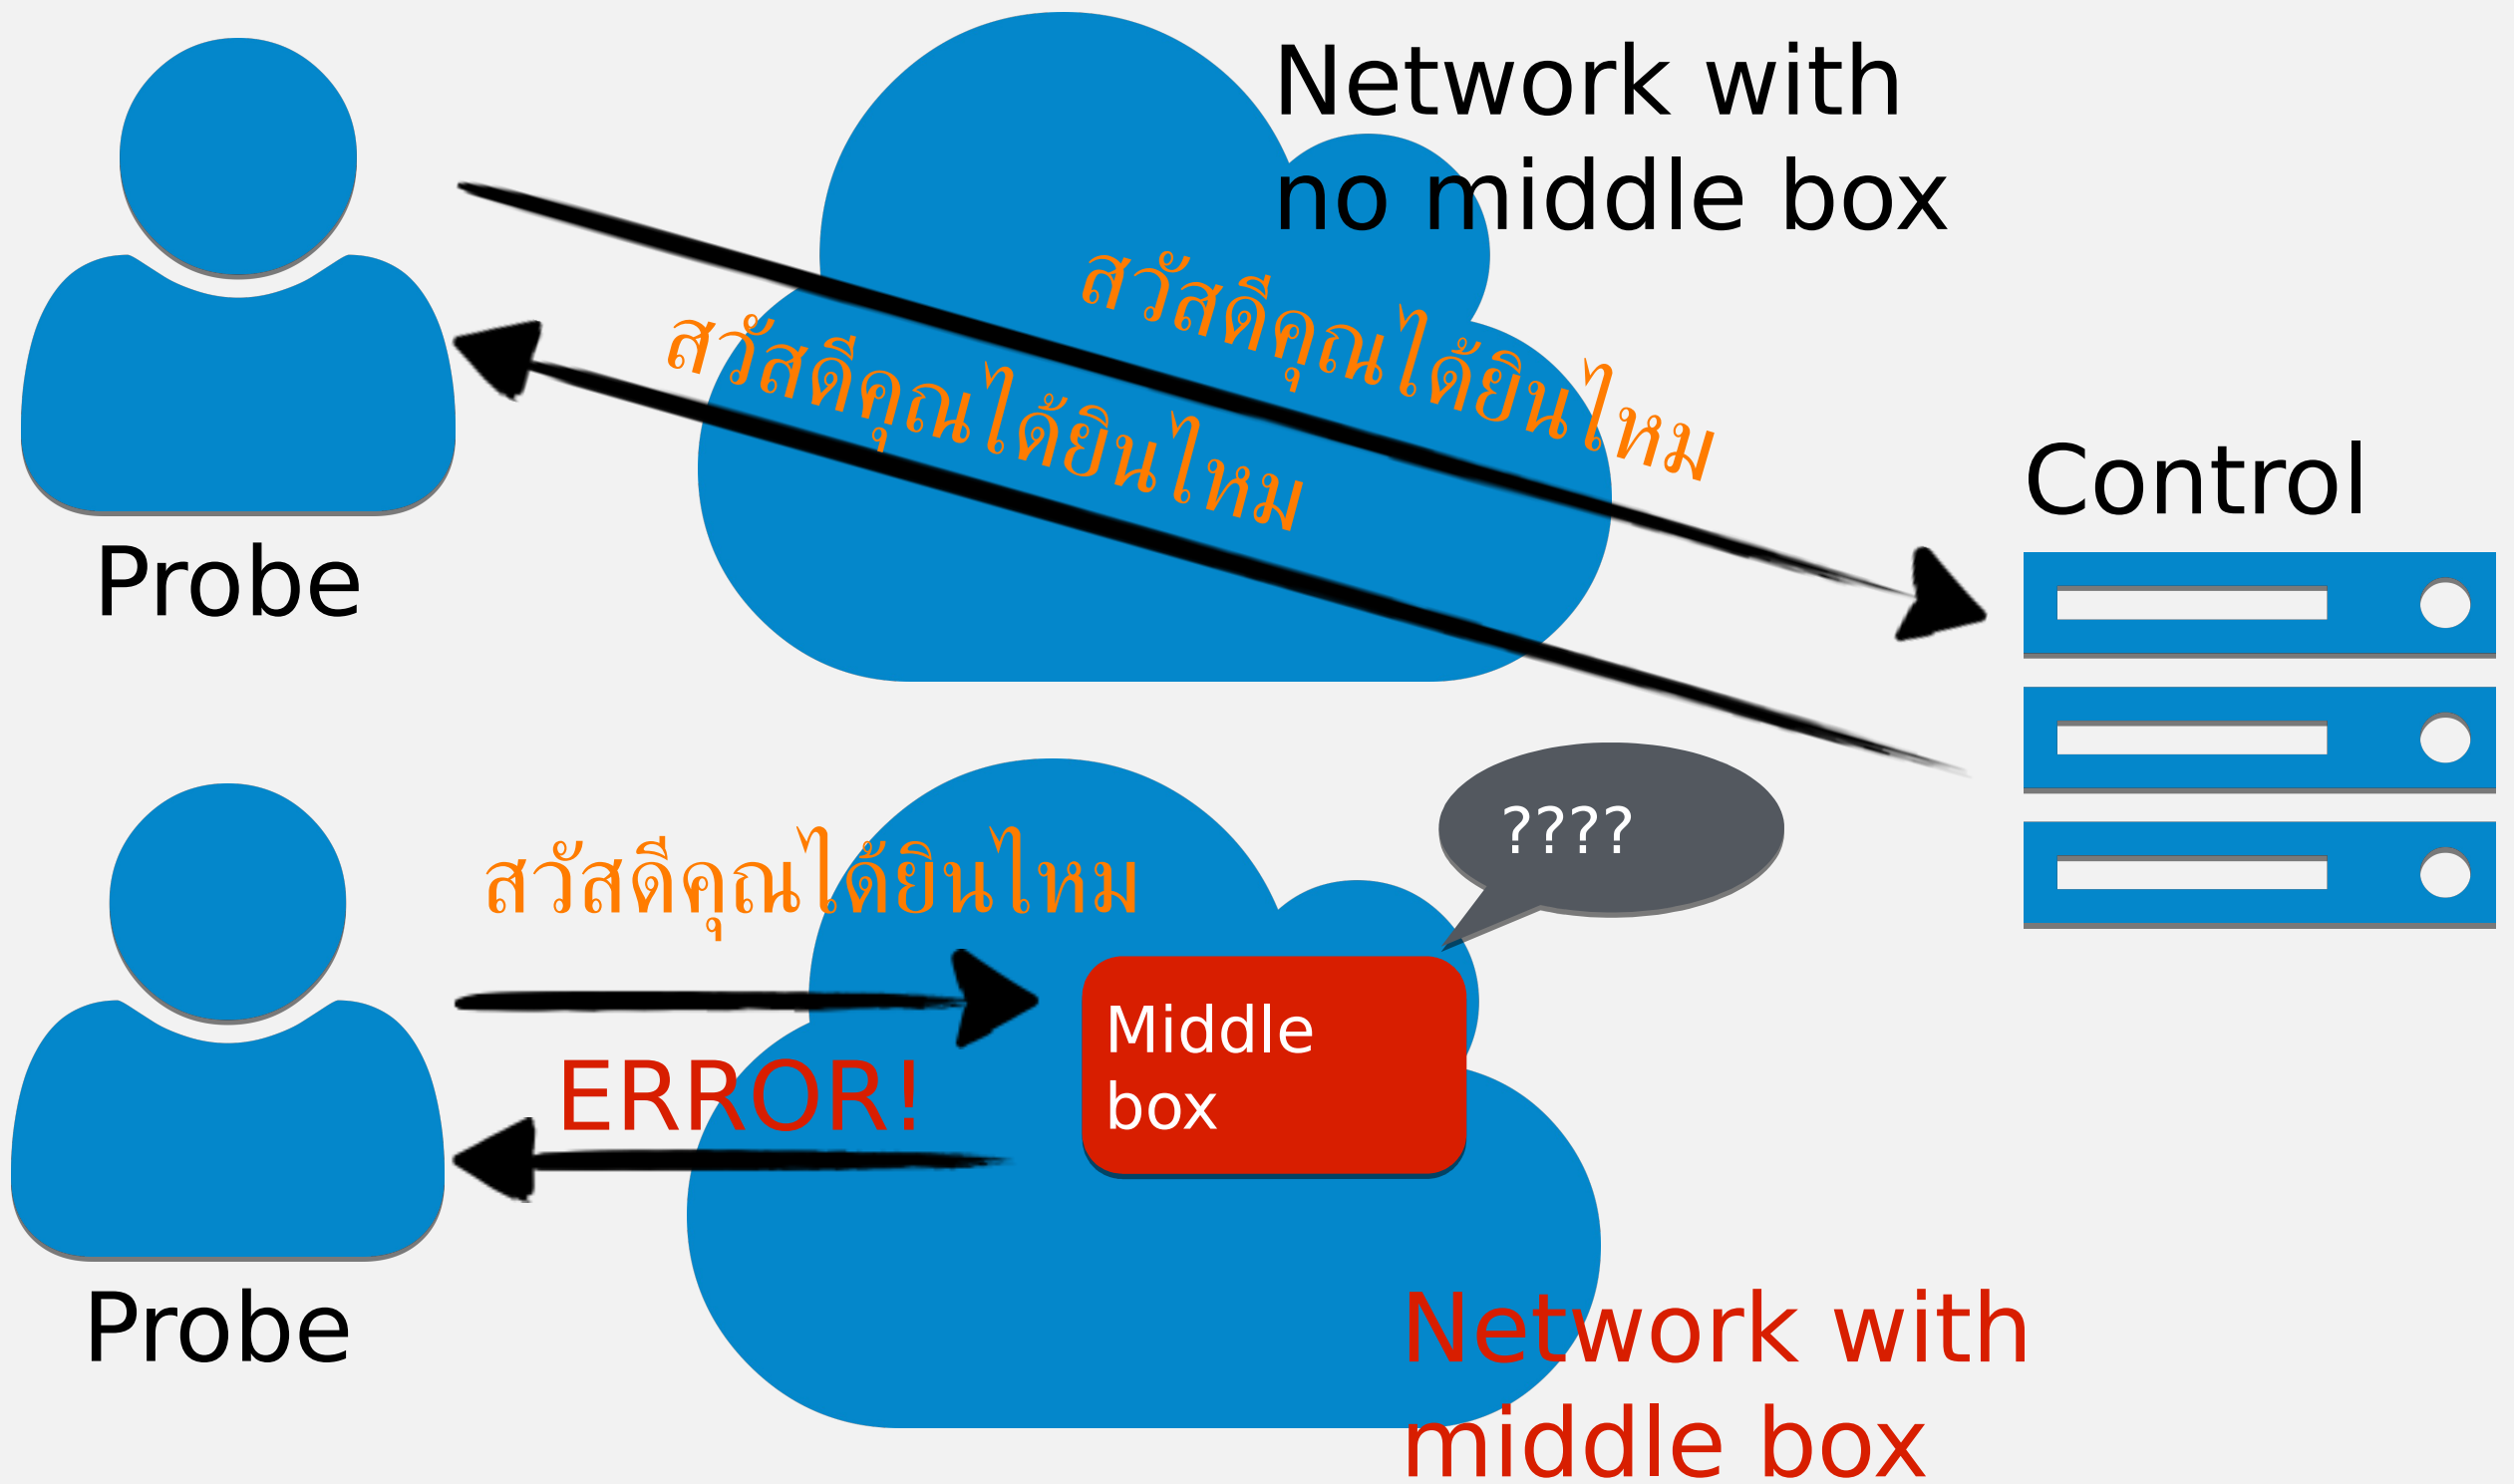

# Web Connectivity

- DNS based blocking: If the DNS responses from the probe are inconsistent with those from the control
- TCP/IP blocking: If TCP connections to the resolved IPs fail
- HTTP based blocking: If only the HTTP request fails OR the pages does not match by looking at:
  - HTML Title tag
  - Body length
  - Response headers
  - HTTP status code

- False positives occur due to:
  - DNS resolvers (such as Google or your local ISP) often provide users with IP addresses that are closest to them geographically so that they can have faster access to sites
  - Some sites serve different content depending on the country that the user is connecting from
  - Sometimes it's hard to distinguish a network failure from a censorship event

# Web Connectivity

HTTP Invalid Request Line

HTTP header  
field manipulation

- OONI has detected the presence of filtering technology across various countries around the world.
- However, not all proxy technologies are used for censorship and/or surveillance. Often, proxy technologies are, for example, used for caching purposes.

Middle boxes:  
Good or Bad?

- Country code (e.g. BR for Brazil)
- Autonomous System Number (ASN)
- Date & time of measurements
- Network measurement data (depending on the type of test)
- Note: IP addresses & other potentially identifying information might unintentionally be collected.
- OONI Data Policy:  
<https://ooni.torproject.org/about/data-policy/>

# Data ooniprobe collects

- Tor hidden services (recommended!)
- HTTPS collectors
- Cloud-fronting

Uploading data to OONI servers

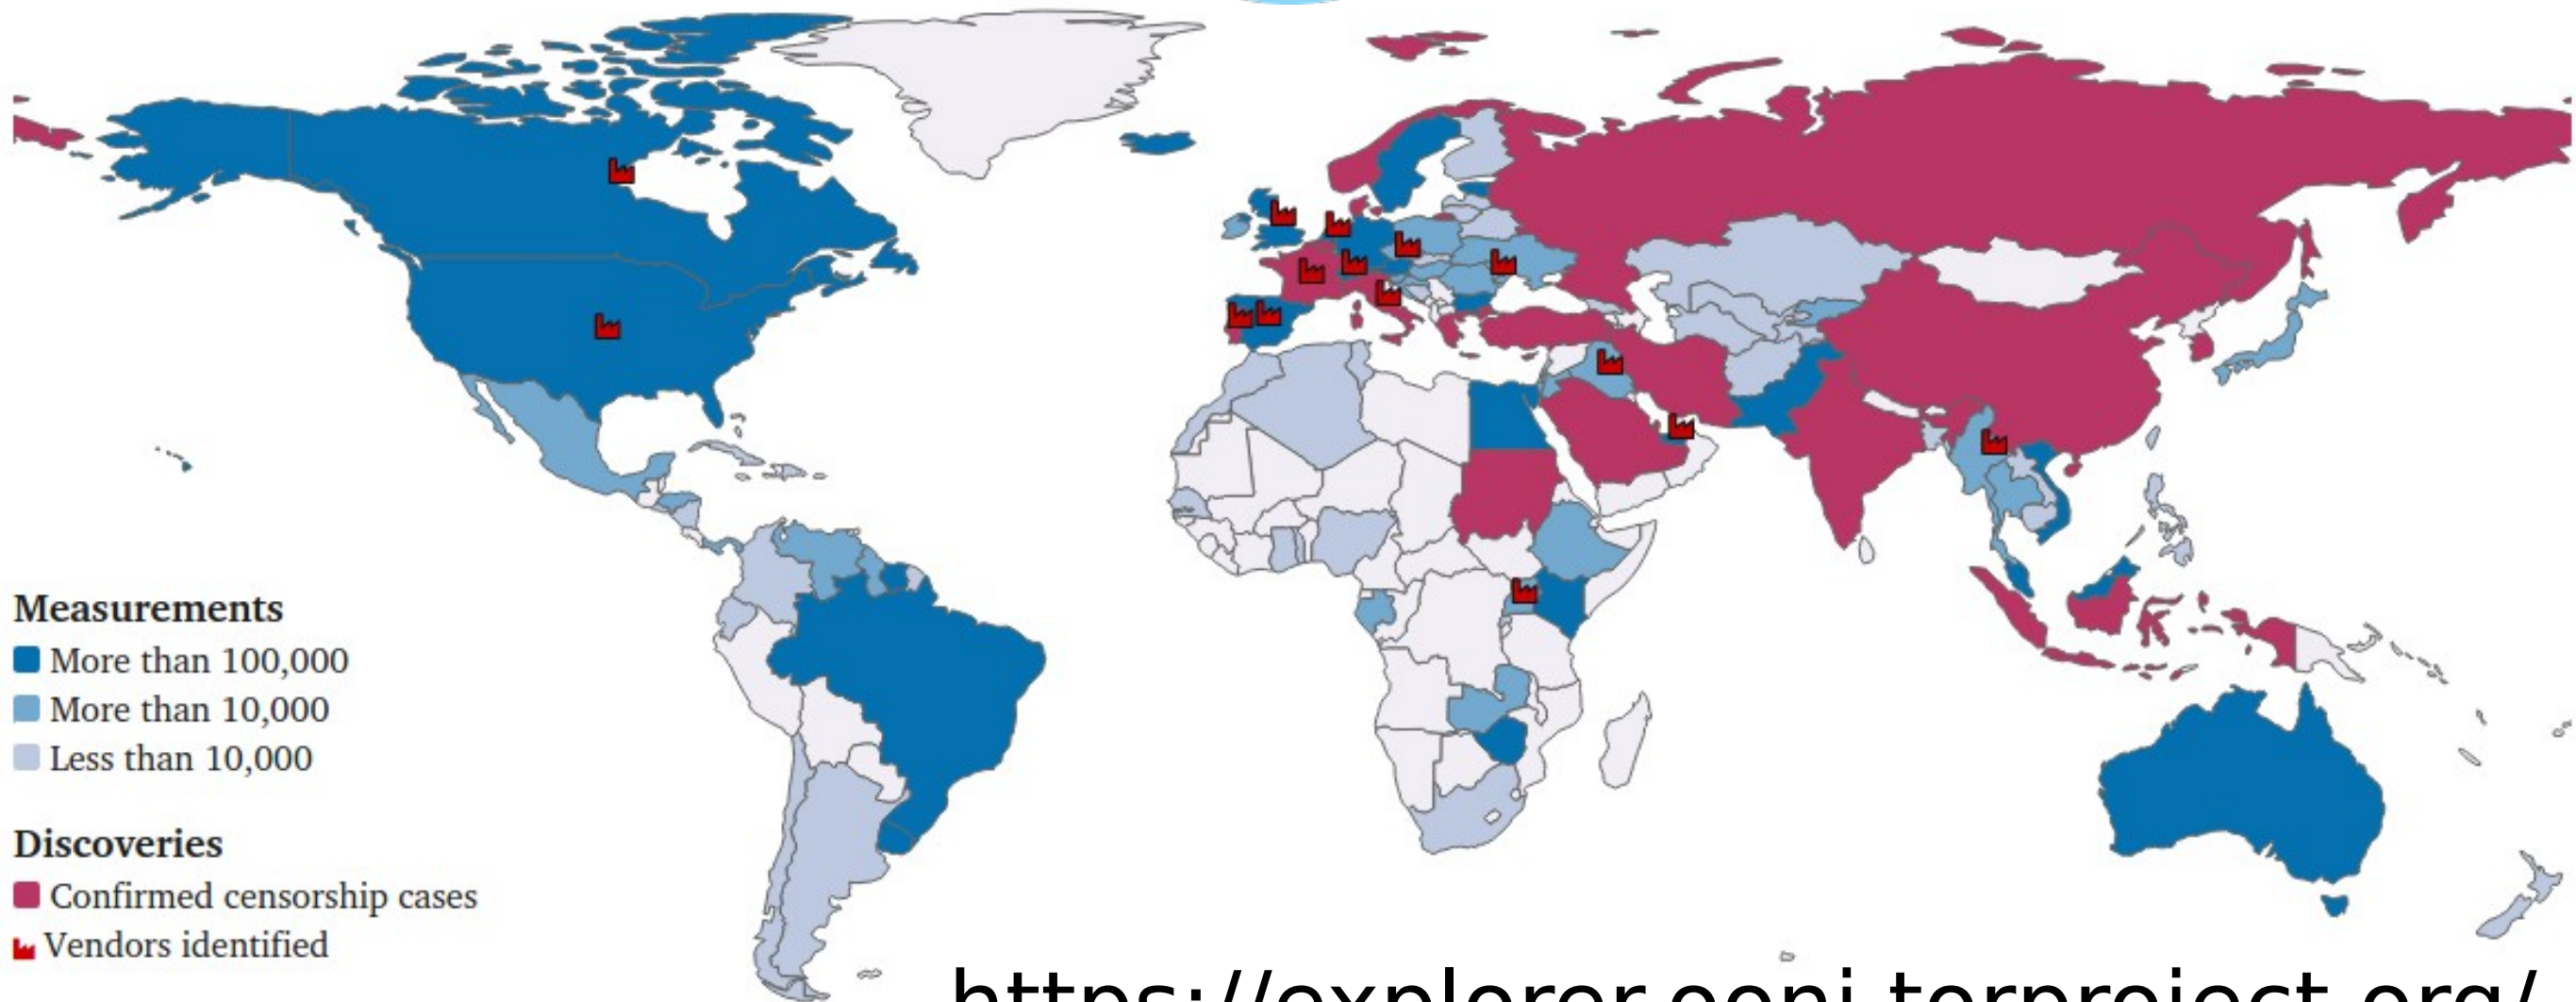

- Evidence of censorship events
- Transparency of global internet controls
- Allows researchers to conduct independent studies & to explore other research questions
- Allows the public to verify OONI's findings

# Open Data

- Legality: Can the blocking of specific types of sites and services be legally justified?
- Circumvention tool strategies: When and where should censorship circumvention tools be promoted the most?
- Story-telling & Advocacy: Where are censorship events occurring and what is their impact on human rights?

# Measurement API

- “Normal” and “anomalous” measurements.
- “Anomalous” measurements MIGHT contain evidence of censorship, but not necessarily (i.e. false positives).
- We only confirm a case of censorship when we have detected a block page.

# Interpreting the data
